## 6.0 Input/Output Functional Description

Symbol	Type	Function
CK0	Input	Positive line of the differential pair of system clock inputs that drives input to the on-DIMM PLL.
$\overline{\text{CK0}}$	Input	Negative line of the differential pair of system clock inputs that drives the input to the on-DIMM PLL.
CKE0~CKE1	Input	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
$\overline{\text{S0}}\sim\overline{\text{S1}}$	Input	Enables the associated SDRAM command decoder when low and disables decoder when high. When decoder is disabled, new commands are ignored but previous operations continue. These input signals also disable all outputs (except CKE and ODT) of the register(s) on the DIMM when both inputs are high.
ODT0~ODT1	Input	I/O bus impedance control signals.
$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{WE}}$	Input	When sampled at the positive rising edge of the clock, $\overline{\text{CAS}}$ , $\overline{\text{RAS}}$ , and $\overline{\text{WE}}$ define the operation to be executed by the SDRAM.
V <sub>REF</sub>	Supply	Reference voltage for SSTL_18 inputs
V <sub>DDQ</sub>	Supply	Isolated power supply for the DDR SDRAM output buffers to provide improved noise immunity
BA0~BA1	Input	Selects which SDRAM bank of four is activated.
A0~A9,A10/AP A11~A13	Input	During a Bank Activate command cycle, Address defines the row address. During a Read or Write command cycle, Address defines the column address. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0, BA1 defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0, BA1 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0 or BA1. If AP is low, BA0 and BA1 are used to define which bank to precharge.
DQ0~63, CB0~CB7	In/Out	Data and Check Bit Input/Output pins
DM0~DM8	Input	Masks write data when high, issued concurrently with input data. Both DM and DQ have a write latency of one clock once the write command is registered into the SDRAM.
V <sub>DD</sub> , V <sub>SS</sub>	Supply	Power and ground for the DDR SDRAM input buffers and core logic
DQS0~DQS17	In/Out	Positive line of the differential data strobe for input and output data.
$\overline{\text{DQS0}}\sim\overline{\text{DQS17}}$	In/Out	Negative line of the differential data strobe for input and output data.
SA0~SA2	Input	These signals are tied at the system planar to either V <sub>SS</sub> or V <sub>DDSPD</sub> to configure the serial SPD EEPROM address range.
SDA	In/Out	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to V <sub>DDSPD</sub> to act as a pullup.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to V <sub>DDSPD</sub> to act as a pullup.
V <sub>DDSPD</sub>	Supply	Serial EEPROM positive power supply (wired to a separate power pin at the connector which supports from 1.7 Volt to 3.6 Volt operation).
$\overline{\text{RESET}}$	Input	The $\overline{\text{RESET}}$ pin is connected to the RST pin on the register and to the OE pin on the PLL. When low, all register outputs will be driven low and the PLL clocks to the DRAMs and register(s) will be set to low level (The PLL will remain synchronized with the input clock )
Par_In	Input	Parity bit for the Address and Control bus. ( "1 " : Odd, "0 " : Even)
$\overline{\text{Err\_Out}}$	Input	Parity error found in the Address and Control bus
TEST	In/Out	Used by memory bus analysis tools (unused on memory DIMMs)

## 8.0 Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	- 1.0 V ~ 2.3 V	V	1
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	- 0.5 V ~ 2.3 V	V	1

Note :

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

## 9.0 AC & DC Operating Conditions

### 9.1 Recommended DC Operating Conditions (SSTL - 1.8)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
$V_{DD}$	Supply Voltage	1.7	1.8	1.9	V	
$V_{DDL}$	Supply Voltage for DLL	1.7	1.8	1.9	V	4
$V_{DDQ}$	Supply Voltage for Output	1.7	1.8	1.9	V	4
$V_{REF}$	Input Reference Voltage	$0.49 \cdot V_{DDQ}$	$0.50 \cdot V_{DDQ}$	$0.51 \cdot V_{DDQ}$	mV	1,2
$V_{TT}$	Termination Voltage	$V_{REF} - 0.04$	$V_{REF}$	$V_{REF} + 0.04$	V	3

Note : There is no specific device  $V_{DD}$  supply voltage requirement for SSTL-1.8 compliance. However under all conditions  $V_{DDQ}$  must be less than or equal to  $V_{DD}$ .

- The value of  $V_{REF}$  may be selected by the user to provide optimum noise margin in the system. Typically the value of  $V_{REF}$  is expected to be about 0.5 x  $V_{DDQ}$  of the transmitting device and  $V_{REF}$  is expected to track variations in  $V_{DDQ}$ .
- Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\% V_{REF}(DC)$ .
- $V_{TT}$  of transmitting device must track  $V_{REF}$  of receiving device.
- AC parameters are measured with  $V_{DD}$ ,  $V_{DDQ}$  and  $V_{DDL}$  tied together.

## 9.2 Operating Temperature Condition

Symbol	Parameter	Rating	Units	Notes
T <sub>OPER</sub>	Operating Temperature	0 to 95	°C	1, 2

Note :

- Operating Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51.2 standard.
- At 85 - 95 °C operation temperature range, doubling refresh commands in frequency to a 32ms period ( tREFI=3.9 us ) is required, and to enter to self refresh mode at this temperature range, an EMRS command is required to change internal refresh rate.

V <sub>SWING</sub> (MAX)	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

Note :

- Input waveform timing is referenced to the input signal crossing through the V<sub>IH/IL</sub>(AC) level applied to the device under test.
- The input signal minimum slew rate is to be maintained over the range from V<sub>REF</sub> to V<sub>IH</sub>(AC) min for rising edges and the range from V<sub>REF</sub> to V<sub>IL</sub>(AC) max for falling edges as shown in the below figure.
- AC timings are referenced with input waveforms switching from V<sub>IL</sub>(AC) to V<sub>IH</sub>(AC) on the positive transitions and V<sub>IH</sub>(AC) to V<sub>IL</sub>(AC) on the negative transitions.

## 15.0 240 Pin DDR2 Registered DIMM Clock Topology

Note:

1. The clock delay from the input of the PLL clock to the input of any DDR2 SDRAM or register will be set to 0ns (nominal).
2. Input, output, and feedback clock lines are terminated from line to line as shown, and not from line to ground.
3. Only one PLL output is shown per output type. Any additional PLL outputs will be wired in a similar manner.
4. Termination resistors for the PLL feedback path clocks are located as close to the input pin of the PLL as possible.
